statistical question as one that anticipates variability in the data related to the question and accounts for it in the answers. For example, "How old am I?" is not a statistical question, but "How old are the students in my school?" is a statistical question because one anticipates variability in students' ages

This leads to what is known as Bayes'

theorem: $P(B | A) = \frac{P(A | B) P(B)}{P(A)}$

Thus, the probability of B given A is the probability of A given B, times the probability of B divided by the probability of A.

This formula is not appropriate if $P(A)=0$, that is if A is an event which cannot happen.
