A bridge, a communication tower and frame of an automobile all are structures. Mechanisms and machines in static configuration, when the forces are balanced and there is no motion, are also analyzed for force interactions under Statics in Engineering Mechanics. Static mechanisms and machines are analogous to structures for force analysis.

analysis of of loads on particles in static equilibrium. To put this in simple terms, statics is the study of forces on something that is not moving. The most helpful method to solving statics problems is making sure the sum of the forces equal zero.

Statics is a branch of mechanics which studies the effects and distribution of forces of rigid bodies which are and remain at rest. In this area of mechanics, the body in which forces are acting is assumed to be rigid. The deformation of non-rigid bodies is treated in Strength of Materials.. There are two types of quantities in physics: scalars and vectors. Scalars have only a magnitude, e.g. time, volume, speed, energy, mass, and density. Vector quantities are described by both a magnitude and direction; examples include displacement, velocity, acceleration, force, moment, and momentum. Speed is velocity with its direction component.

The space station Chassis of your car Your chair, table, bookshelf etc. etc. For instance: Almost everything has an internal structure and can be thought of as a "structure". The objective of this chapter is to figure out the forces being carried by these structures so that as an engineer, you can decide whether the structure can

We first discuss Newton's laws and basic concepts of what is a force, vectors, and the dimensions and units involved. Then we consider systems of forces and how to compute their resultants. We discuss the main characteristics of vectors and how to manipulate them. Then the meaning and computation of moments and couples.
