FLUID STATICS. Fluid statics is all about pressure. Here are the rules; 1. Pressure at any point in a fluid is the same in all directions and is transmitted through static fluids without loss (Pascal's principle) 2. From 1, the pressure at the wall of any vessel is perpendicular to the wall

Fluid statics is the study of fluid problems in which there is no relative motion between fluid elements. With no relative motion between individual elements (and thus no velocity gradients), no shear can exist, whatever the viscosity of the fluid is. Accordingly, viscosity has no effect in

LECTURE NOTES - II

Fluid Statics is a branch of mechanics of fluid which deals primarily with fluids at rest. As individual elements do not move relative to each other,

shear stresses are not involved and all forces due to the pressure of the fluid are normal to the surfaces on which they acts. CN2122 / TCN2122E 3.1

Fluid statics is the branch of fluid mechanics that studies incompressible fluids at rest. It encompasses the study of the conditions under which fluids are at rest in stable equilibrium as opposed to fluid dynamics, the study of fluids in motion. 1 1.0:

fluid(sv: fluid) is a liquid or a gas
The behaviour of stationary fluids is described by fluid statics. A liquid in a container forms a layer with a distinct surface, and exerts forces on the walls supporting it, while a gas will fill the whole container.

For a static fluid, the only stress is the normal stress since by definition a fluid subjected to a shear stress must deform and undergo motion. Normal stresses are referred to as pressure p . For the general case, the stress on a
