Functional Atlas of the Human Fascial System opens with the first chapter classifying connective tissue and explaining its composition in terms of percentages of fibres, cells and extracellular matrix. The second chapter goes on to describe the general characteristics of the superficial fascia from a macroscopic and microscopic point of view; while the third analyzes the deep fascia in the same manner.

In this study the organization of networks in the human cerebrum was explored using resting-state functional connectivity MRI. Data from 1,000 subjects were registered using surface-based alignment. A clustering approach was employed to identify and replicate networks of

Principally based on dissections of hundreds of un-embalmed human cadavers over the past decade, Functional Atlas of the Human Fascial System presents a new vision of the human fascial system using anatomical and histological photographs along with microscopic analysis and biomechanical evaluation. Prof. Carla Stecco – orthopaedic surgeon and professor of anatomy and sport activities – brings together the research of a multi-specialist team of researchers and clinicians consisting of anatomists, biomechanical engineers, physiotherapists, osteopaths and plastic surgeons. In this Atlas Prof. Stecco presents for the first time a global view of fasciae and the

actual connections that describe the myofascial kinetic chains. These descriptions help to explain how fascia plays a part in myofascial dysfunction and disease as well as how it may alter muscle function and disturb proprioceptive input. Prof. Stecco also highlights the continuity of the fascial planes, explaining the function of the fasciae and their connection between muscles, nerves and blood vessels. This understanding will help guide the practitioner in selecting the proper technique for a specific fascial problem with a view to enhancing manual therapy methods. from a macroscopic and microscopic point of view; while the third analyzes the deep fascia in the same manner. The subsequent five chapters describe the fasciae from a topographical perspective. In this part of the Atlas, common anatomical terminology is used throughout to refer to the various fasciae but it also stresses the continuity of fasciae between the different bodily regions. Over 300 unique photographs which show fascia on fresh (not embalmed) cadavers Demonstrates the composition, form and function of the fascial system Highlights the role of the deep fascia for proprioception and peripheral motor coordination Companion website www.atlasfascial.com with videos showing how fascia connects with ligaments

"This atlas is for students and practitioners in many health and life science fields. It

makes no pretense of being complete; what is of interest and importance to one specialty may only be of passing curiosity to another, The subject matter of each plate has been carefully considered for its usefulness as standard reference material for the understanding of human anatomym physiological principles, and frequently encountered pathological conditions" (from Preface).

Basic principles of anatomy are presented, explaining the function and structure of body systems and organs.

A guide for students in fields related to medicine who need to know something about anatomy but not too much, and for general readers who are interested.

Presents photographs of actual body parts and organs, and next to them line drawings identifying the components. Translated

Human Atlas of the Facial System published by F. K. Schattauer Verlag, Stuttgart, in 1997. Annotation copyrighted by Book News, Inc., Portland, OR.

The monography entitled "Human Atlas of Topographical, Functional and Clinical Anatomy Viscera" developed by a prestigious collective coordinated by Acad. Prof. PhD. M.D. Mircea Ifrim, is an absolute editorial novelty. The approach of numerous aspects of the complexity of "the human phenomenon," which is the object of anthropology, is original through multiple aspects, out of which we mention the metapsychological one, and at the same time, a reality that defines the constitutional typology in which we find multiple unknown data. At the same time, it is a reality which defines the constitutional typology. This monography contains fundamental elements, many

resulting from both practical experience and author's own research. The coordinator of this monography is Acad. Prof. PhD. M.D. Mircea Ifrim, a medical doctor, a Univ. Prof. M.D Ist degree Scientific Researcher, General Secretary of the Romanian Medical Science Academy, Deputy General Manager of the Institute of Life Sciences of the "Vasile Goldis" Western University in Arad, a doctor in Philosophy of "Albert Schweitzer" International Academy of Medicine. Acad. Mircea Ifrim has climbed up on the medical hierarchical ladder, from a doctor in a regional practice to university professor and academician by hard work and international recognition of his professional achievements. He was awarded numerous honors and appointments such as General Inspector, Adviser to the Minister of Education, Governmental Adviser, State Secretary for

The recent advances in neuroimaging techniques, particularly magnetic resonance (MR), have greatly improved our knowledge of brain anatomy and related brain function. Morphological and functional investigations of the brain using high-definition MR have made detailed study of the brain possible and provided new data on anatomo-functional correlations. These studies have fuelled the interest in central nervous system imaging by clinicians (neuro-radiologists,

neurosurgeons, neurologists, neurophysiologists, and psychiatrists) as well as biophysicists and bioengineers, who are at work on new and ever more sophisticated acquisition and processing techniques to continue to improve the potential of brain imaging methods. The possibility of obtaining high-definition MR images using a 3.0-T magnet prompted us, despite the broad existing literature, to conceive an atlas illustrating in a simple and effective way the anatomy of the brain and correlated functions. Following an introductory chapter by Prof. Pierre Rabischong, the atlas is divided into a morphological and a functional imaging section. The morphological atlas includes 3D surface images, axial, coronal, and sagittal scans acquired with high-definition T2 fast spin echo (FSE) sequences, and standard and inverted-contrast images. The MR scans are shown

side by side with the corresponding anatomical brain sections, provided by Prof. Henri Duvernoy, for more effective comparison. The anatomical nomenclature adopted for both the MR and the anatomical images is listed in a jacket flap for easier consultation.

diFiore's Atlas of Histology with Functional Correlations explains basic histology concepts through realistic, full-color composite and idealized illustrations of histologic structures. Added to the illustrations are actual photomicrographs of similar structures, a popular trademark of the atlas. All structures are directly correlated with the most important and essential functional correlations, allowing students to efficiently learn histologic structures and their major functions at the same time.
