Kinematic equations relate the variables of motion to one another. Each equation contains four variables. The variables include aceleration (a), time (t), displacement (d), final velocity (vf), and initial velocity (vi). If values of three variables are known, then the others can be calculated using the equations. This page demonstrates the process with 20 sample problems and accompanying ...

Kinematic Equations: Sample Problems and Solutions

The equation for force due to gravity is $F=G(m_1m_2/r^2)$, therefore decreasing on mass (in this case the moon has less mass than the Earth) lessens the force of gravity.

The question is asking about density, and that is the ratio of mass to volume. Therefore, the first rock is denser, (density = 3.0) and the second rock is less dense even though it weighs more, because its density is only 2.0. This example shows why it is important to be careful to not use the words heavier/lighter when you means more or less dense.
