Type of microscopy that produces an image made from light that is transmitted through a specimen. The specimen restricts light transmission and appears "shadowy" against a bright background (where light enters the microscope unimpeded). Most common type of microscopy and was first type of microscopy discovered. Field of view is always illuminated.

Introduction “Micro” refers to tiny, “scope” refers to view or look at. Microscopes are tools used to enlarge images of small objects so as they can be studied. The compound light microscope is an instrument containing two lenses, which magnifies, and a variety of knobs to resolve (focus) the picture. Because it uses more than one lens, it is sometimes called the compound microscope in addition to being referred to as being a light microscope.

JUNCTION

This book offers a beginner's guide to using light microscopes. It begins with a brief introduction to the physics of optics, which will give the reader a basic grasp of the behaviors of light. In turn, each part of the microscope is explained using clear and simple English, together with detailed photographs and diagrams.

Introduction to Microscopy
Microscopes are instruments designed to produce magnified visual or photographic images of objects too small to be seen with the naked eye. The microscope must accomplish three tasks: produce a magnified image of the specimen, separate the details in the image, and render the details visible to the human eye or camera.
