Besides, the engine sensors provide the Engine Management System with vital data parameters in real-time. These engine sensors continuously monitor the engine parameters. They also provide the ECU with changes that occur in the data from time to time. Based on these inputs, the ECU re-calculates the correct air-fuel ratio and ignition timing. It also calculates and supplies the correct amount of fuel to the engine under various load conditions.

Oxygen sensor; This sensor calculates the amount of oxygen present in the exhaust pipe. based on this calculation, it can determine if the car is burning rich or lean. Again if this sensor fails, the car can consume more fuel and it can even idle or jerk often. Manifold Absolute Pressure sensor or MAP sensor; This sensor monitors the engine load.

The Cummins M-series engine is a straight-six diesel engine designed and produced by Cummins. It displaces 10.8 litres. Introduced as the M11 in 1994, it was built on the previous L10 engine. Later M11's received the electronic CELECT and CELECT Plus fuel systems consisting of a gear pump and solenoid controlled injectors. The M11 CELECT Plus became the ISM when Cummins applied its Interact System to the M11 CELECT Plus in 1998 to further improve the engine. The ISM is available in four configur
