Localization refers to the relationship between the anatomical structures of the brain and their corresponding psychological or behavioral functions. Throughout the history of neuropsychology, there has been considerable debate over how localized mental functions truly are. By the mid-20th century, a formidable amount of evidence strongly supported the "modularity hypothesis" that psychological functions such as language and memory reside in specific neuroanatomical areas.

Prior work has shown that both group-level atrophy in clinical dementia syndromes and complex neurological symptoms in patients with focal brain lesions localize to brain networks. Here, we use a new technique termed 'atrophy network mapping' to test the hypothesis that single-subject atrophy maps in patients with a clinical diagnosis of Alzheimer's disease will also localize to syndrome-specific and symptom-specific brain networks.

Localization of clinical syndromes using DWI: two examples of the "capsular" warning syndrome. Oliveira-Filho J (1), Ay H, Koroshetz WJ, Buonanno FS. (1)Department of Neurology-Stroke Service, Blake 1291B, Massachusetts General Hospital, Harvard Medical School, 55 Fruit Street, Boston, MA 02114, USA. The capsular warning syndrome (CWS) is a subtype of transient ischemic attack characterized by its recurrent nature, absence of cortical signs, and high probability of early capsular stroke.

The mechanistic interpretation of network localization remains unclear. One possibility is that clinical symptoms in neurological diseases can result from dysfunction in a connected but undamaged brain region through a mechanism termed diaschisis (Carrera and Tononi, 2014). Alternatively, network localization may suggest that a complex symptom localizes to the interactive functioning of the entire network, rather than any specific location or node within that network.

All three of the syndromes with linkage evidence are generalized epilepsies, in which seizures are presumed to involve the entire brain from the outset^{11,12}. Most localization-related (partial or focal) epilepsies¹², in which seizures begin in a specific brain region, are assumed to be nongenetic.

studies suggest a more holistic view - that psychological functions are distributed and dynamically organized across multiple brain regions. This book attempts to reconcile the classic and modern approaches, arguing that newer imaging techniques must be used in conjunction with, rather than replace, traditional neuropsychology approaches such as interviewing, testing, and autopsy exams. Only by triangulating these approaches can neuropsychologists begin to understand the complex relationship between brain structure and mental function that is exhibited across the spectrum of neurological disorders. The perspective offered by Drs. Tonkonogy and Puente on this philosophical and scientific debate is a provocative counterargument to current research that overemphasizes imaging studies to the exclusion of other useful techniques. Key features: Offers systematic descriptions of the clinical manifestations, anatomical data, and history of the various approaches to neuropsychological syndromes Differentiates syndromes characterized by disturbances of conventional versus unconventional information processing Examines both traditional and modern approaches to new neuropsychological syndromes of social agnosia, social apraxia, and agnosia of actions, as well as memory disorders, visual disorders, and more An indispensable resource for clinicians and researchers in neuropsychology and neuroscience, this book serves as a solid frame of reference for the localization of clinical neuropsychological symptoms."
