About this Textbook. Petrogenesis of Metamorphic Rocks presents a large number of diagrams showing the stability relations among minerals and groups of minerals found in metamorphic rocks. The diagrams help to determine the pressure and temperature conditions under which a given set of metamorphic rocks may have formed.

In Petrogenesis of Metamorphic Rocks, Bucher and Grapes address a variety of important effects that receive limited treatment elsewhere. As with other texts, FASH, NCMASH, and related thermodynamic models are used to represent theoretical mineral stabilities in a pressure, temperature regime for a rock of given chemistry, and resultant assemblages are compared with site-specific studies.

Metamorphism is the change of minerals or geologic texture (distinct arrangement of minerals) in pre-existing rocks (), without the protolith melting into liquid magma (a solid-state change). The change occurs primarily due to heat, pressure, and the introduction of chemically active fluids. The chemical components and crystal structures of the minerals making up the rock may change even ...
