Does it only happen when you've been active, or when you're not doing anything? Is there any pain when you breathe? Do you have a cough? Do certain positions make it worse – for example, are you unable to lie down? Feeling like you can't get enough air can be terrifying, but doctors are well trained in managing this. You may be given extra oxygen to breathe if this is needed. Causes of ...

A new theory of consciousness and the construction of identity focuses on the body's reaction to its world, postulating that a complex relationship between body, emotion, and mind is required to configure the self. Reprint. 50,000 first printing.

There have been many ambitious and important books on the problem of consciousness in the past few years. None has quite the philosophical sophistication and neurophysical knowledge of this one. One of the world's leading experts on the neurophysiology of emotion, professor Damasio shows how our consciousness developed out of the development of emotion brilliantly wide ranging, with fascinating case-studies, the book presents a humane and subtle view of the facility that makes us most profoundly human.

Investigates the cerebral mechanisms behind emotions and feelings to explain the role between emotion, survival, and cultural accomplishment.

Linking the process of rational decision making to emotions, a scientist who has done extensive research with brain-damaged patients notes the dependence of thought processes on feelings and the body's survival-oriented regulators. Reprint.

An argument that consciousness, more widespread than previously assumed, is the feeling of being alive, not a type of computation or a clever hack. In *The Feeling of Life Itself*, Christof Koch offers a straightforward definition of consciousness as any subjective experience, from the most mundane to the most exalted--the feeling of being alive. Psychologists study which cognitive operations underpin a given conscious perception. Neuroscientists track the neural correlates of consciousness in the brain, the organ of the mind. But why the brain and not, say, the liver? How can the brain, three pounds of highly excitable matter, a piece of furniture in the universe, subject to the same laws of physics as any other piece, give rise to subjective experience? Koch argues that what is needed to answer these questions is a quantitative theory that starts with experience and proceeds to the brain. In *The Feeling of Life Itself*, Koch outlines such a theory, based on integrated information. Koch describes how the theory explains many facts about the neurology of consciousness and how it has been used to build a clinically useful consciousness meter. The theory predicts that many, and perhaps all, animals experience the sights and sounds of life; consciousness is much more widespread than conventionally assumed. Contrary to received wisdom, however, Koch argues that programmable computers will not have consciousness. Even a perfect software model of the brain is not conscious. Its simulation is fake consciousness. Consciousness is not a special type of computation--it is not a clever hack. Consciousness is about being.

From one of the world's leading neuroscientists--a succinct, illuminating, wholly engaging investigation of the phenomenon of consciousness. In recent decades, many philosophers and cognitive scientists have declared the question of consciousness unsolvable, but Antonio Damasio is convinced that recent findings in neurobiology, psychology, and AI have given us the necessary tools to solve its mystery. Now, he not only elucidates its myriad aspects, but presents his analysis and insights in a way that is faithful to our own intuitive sense of the experience of consciousness. In the 45 brief chapters of the book, he helps us understand the relation between consciousness and mind; why being conscious is not the same as either being awake or sensing; the essential role of feeling; and the biological brain and development of consciousness. He synthesizes the recent findings of various sciences with the outlook of philosophy, and, most significantly, presents his original research which has transformed our understanding of the brain and human behavior. Here is an indispensable guide to understanding consciousness, the fundamental human capacity for informing--and transforming--our experience of the world around us and our perception of our place in it.

Bestselling and award-winning author Trista Mateer takes an imaginative approach to self-care in this new poetry and prose collection, *Aphrodite Made Me Do It*. In this empowering retelling, she uses the mythology of the goddess to weave a common thread through the past and present. By the end of this book, Aphrodite will make you believe in the possibility of your own healing.

Humphrey's principal paper is followed by commentaries on Humphrey's theory, which consist of ten essays by various authors, and then followed by Humphrey's reply to commentators.

"In *The Power of Strangers*, journalist Joe Keohane takes us through an inquiry into our shared history, one that offers surprising and compelling insights into our own social and political moment. But if strangers seem to some to be the problem, history, data, and science show us that they are actually our solution. In fact, throughout human history, our address to the stranger, the foreigner, the marginalized, and the other has determined the fate and well-being of both nations and individuals. A raft of new science confirms that the more we open ourselves up to encounters with those we don't know, the healthier we are. Modern cities are vast clusters of strangers. Technology has driven many of us into silos of isolation. Through deep immersion with sociologists, psychologists, neuroscientists, theologians, philosophers, political scientists and historians, Keohane learns about how we're wired to sometimes fear, distrust, and even hate strangers; what happens to us--as individuals, groups, and as a culture--when we indulge those biases; and at the same time, he digs into a growing body of cutting-edge research on the surprising social and psychological benefits that come from talking to strangers; how even passing interactions with strangers can enhance empathy, happiness, and cognitive development, ease loneliness and isolation, and root us in the world, deepening our sense of belonging; how paradoxically, strangers can help us become more fully ourselves. Keohane explores the ways in which biology, culture, and history have defined us and our understanding of people we don't know"--

The reader's experience with this beautiful collection is lifted from the page; as Tavon used music as his muse while crafting each poem. This collection is divided into five playlists: 4 Her, The Healing Process, Nostalgia, Feels Good to Feel Good, that elicits a different emotion. The writing is raw and melodic as each poem is paired with a song so readers can develop a deeper connection. Themes such as finding happiness, friendships, making love are all expressed by the author.
